

Workshop In IIT Chennai

This is the basic model of an automated car. This model has been done in a robotic workshop conducted by IIT Chennai. This model involves basics in electronics and robotics. The two protruding strips in the image are the obstacle sensors. These two sensors detect the presence of obstacles and turn accordingly. If the sensors detect the presence of obstacle in the same time, the car stops. This idea of automated cars is widely being used.

Participating in a workshop conducted by IIT Chennai really makes me feel proud as I was able to go to a reputed institute in my young age
